

Static Management Program

The Next Generation of ESD Process Control

Continuously monitor your entire ESD process control system throughout all stages of manufacturing.

SCS Static Management Program (SMP) continuously monitors your ESD process control system throughout all stages of manufacturing. SMP captures data from SCS workstation, equipment and ESD event continuous monitors and provides a real-time picture of critical manufacturing processes. All activity is stored into a database for on-going quality control purposes. SMP allows you to pinpoint areas of concern and prevent ESD events. Quantifiable data allows you to see trends, become more proactive and prove the efficiency of your ESD process control system.

SCS supports manufacturers in their efforts to make more dependable products, improve yields, increase automation and provide a measurable return on investment.

The four-part program consists of:

1. Facility Assessment
2. Hardware and Software Installation
3. Hardware and Software Training
4. Ongoing Technical Support
